

The Provisia™ Rice System

The **Provisia™** Rice System, when used in rotation with the **Clearfield®** Production System for rice, gives growers more operational control, increasing production options while allowing for rotating different herbicide modes of action to manage red and weedy rice types.

How The Provisia™ Rice System® Works

The **Provisia** Rice system is comprised of **Provisia** seed containing the **Provisia** trait, which allows growers to safely apply **Provisia** herbicide. Used in rotation with the **Clearfield** Production System for rice, growers can plant a rice-rice-soybean rotation. You also get flexibility to plant rice on more acres while rotating different herbicide modes of action (ALS, ACCase) for sustainable management of all resistant rice types and annual grasses.

This dual system helps simplify farm management by ensuring uniform maturity of the crop and allowing growers to plan herbicide applications in advance, ensuring control of red rice, weedy rice and other annual grasses. The **Provisia** Rice System allows rice acres lost to weedy rice to come back into production at least two years sooner than traditional management recommendations.

A stewardship program of the **Provisia** Rice System and the **Clearfield** Production System for rice and soybeans on a three-year rotation ensures sustainable management of all resistant rice types and annual grasses.
