

Vivando Fungicide

Vivando® fungicide features a unique mode of action that provides maximum powdery mildew control and yield protection for wine, table and raisin grapes. **Vivando's** active ingredient and unique multilevel protection against powdery mildew improves coverage and cluster penetration. Plus, it offers flexible use rates and application timing, making it a must-have resistance management tool.

How Vivando Fungicide ® Works

The active ingredient in **Vivando**, metrafenone, specifically disrupts the proper functioning of the powdery mildew cells. **Vivando's** unique mode of action works to prevent infections by stopping successful powdery mildew penetration. Although **Vivando** works best when applied preventively before powdery mildew infections occur, it also provides targeted protection by interfering with lesion growth and sporulation.

Vivando works via surface migration redistribution — that is, it spreads via vapor and then redeposits onto the plant to improve coverage and protection inside the grape clusters. It delivers fast cuticle uptake and binding for exceptional rainfastness.

Vivando offers flexible use rates and application timing intervals and is compatible as a tank-mix or with adjuvants. In fact, the addition of nonphytotoxic adjuvants has been shown to improve the performance of **Vivando**.

When applied preventively and in spray programs with other modes of action such as **Pristine**® fungicide, **Vivando** safeguards the yield and quality potential for your grape crops. So say hello to **Vivando** — and "adios" to powdery mildew.
